

Research activities at Vienna University of Technology on promotion of Renewables and decentralised energy supply

Reinhard Haas, Amela Ajanovic

**Energy Economics Group,
Vienna University of Technology**

- ▶ Starting from an energy-economic assessment of decision-making for purchasing energy services:

$$S = E \eta(T)$$

$$S = f(Y, p_s, WTP(s))$$

- ▶ Modeling dynamic processes based on technological learning, cost resource curves of potentials and policy measures
- ▶ Combining bottom-up (technical) modeling with top-down (econometric) analyses

Major research areas

**Electricity
from
RES**

Liberalisation
& (re-)regulation
of electricity
markets

**Energy
efficiency**

**Heat from
RES (incl.
buildings)**

**Alternative fuels &
automotive systems**

SUPPLY

DEMAND

- 1. Introduction mission / research focuses**
- 2. Liberalised vs regulated electricity markets**
- 3. Promotion of renewables for electricity & heat**
- 4. Promotion of alternative fuels and alternative automotive systems in transport**
- 5. Outlook**

1. Mission statement

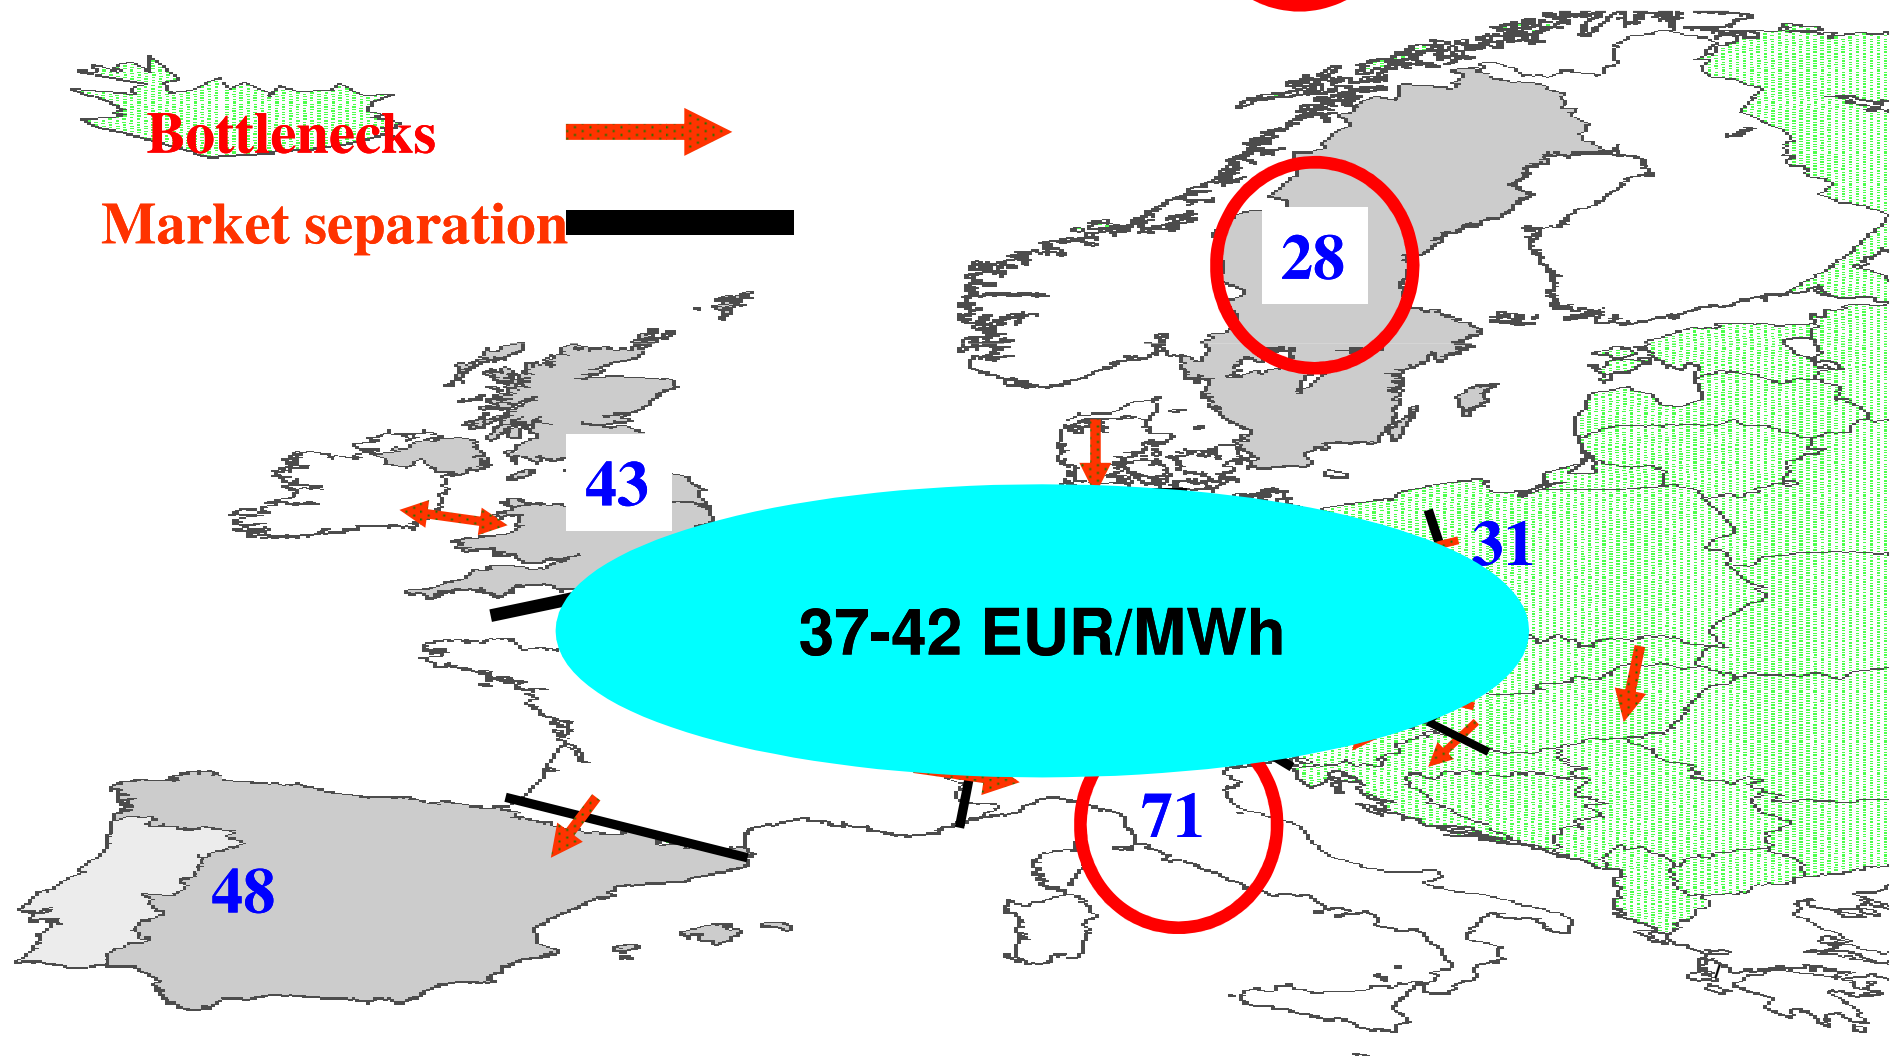

- Our current standard of living – all goods and services we enjoy – is based on the consumption of energy
- However, this system is currently not sustainable. Renewable energy sources as well as more efficient and more careful ways to use energy are cornerstones in converting our economy into a sustainable system
- The objective of the EEG is, to contribute significantly to this process

2. Liberalised vs regulated electricity markets

- Major objective of liberalisation of ESI in Europe: lead to ONE European electricity market
- Core motivation:
LIB → Competition! → lower prices!

1. INTRODUCTION

Average wholesale electricity price 2007 [€/MWh]

1. INTRODUCTION

- 2007: Slow convergence of spot prices?

1. INTRODUCTION

- At some times convergence of spot

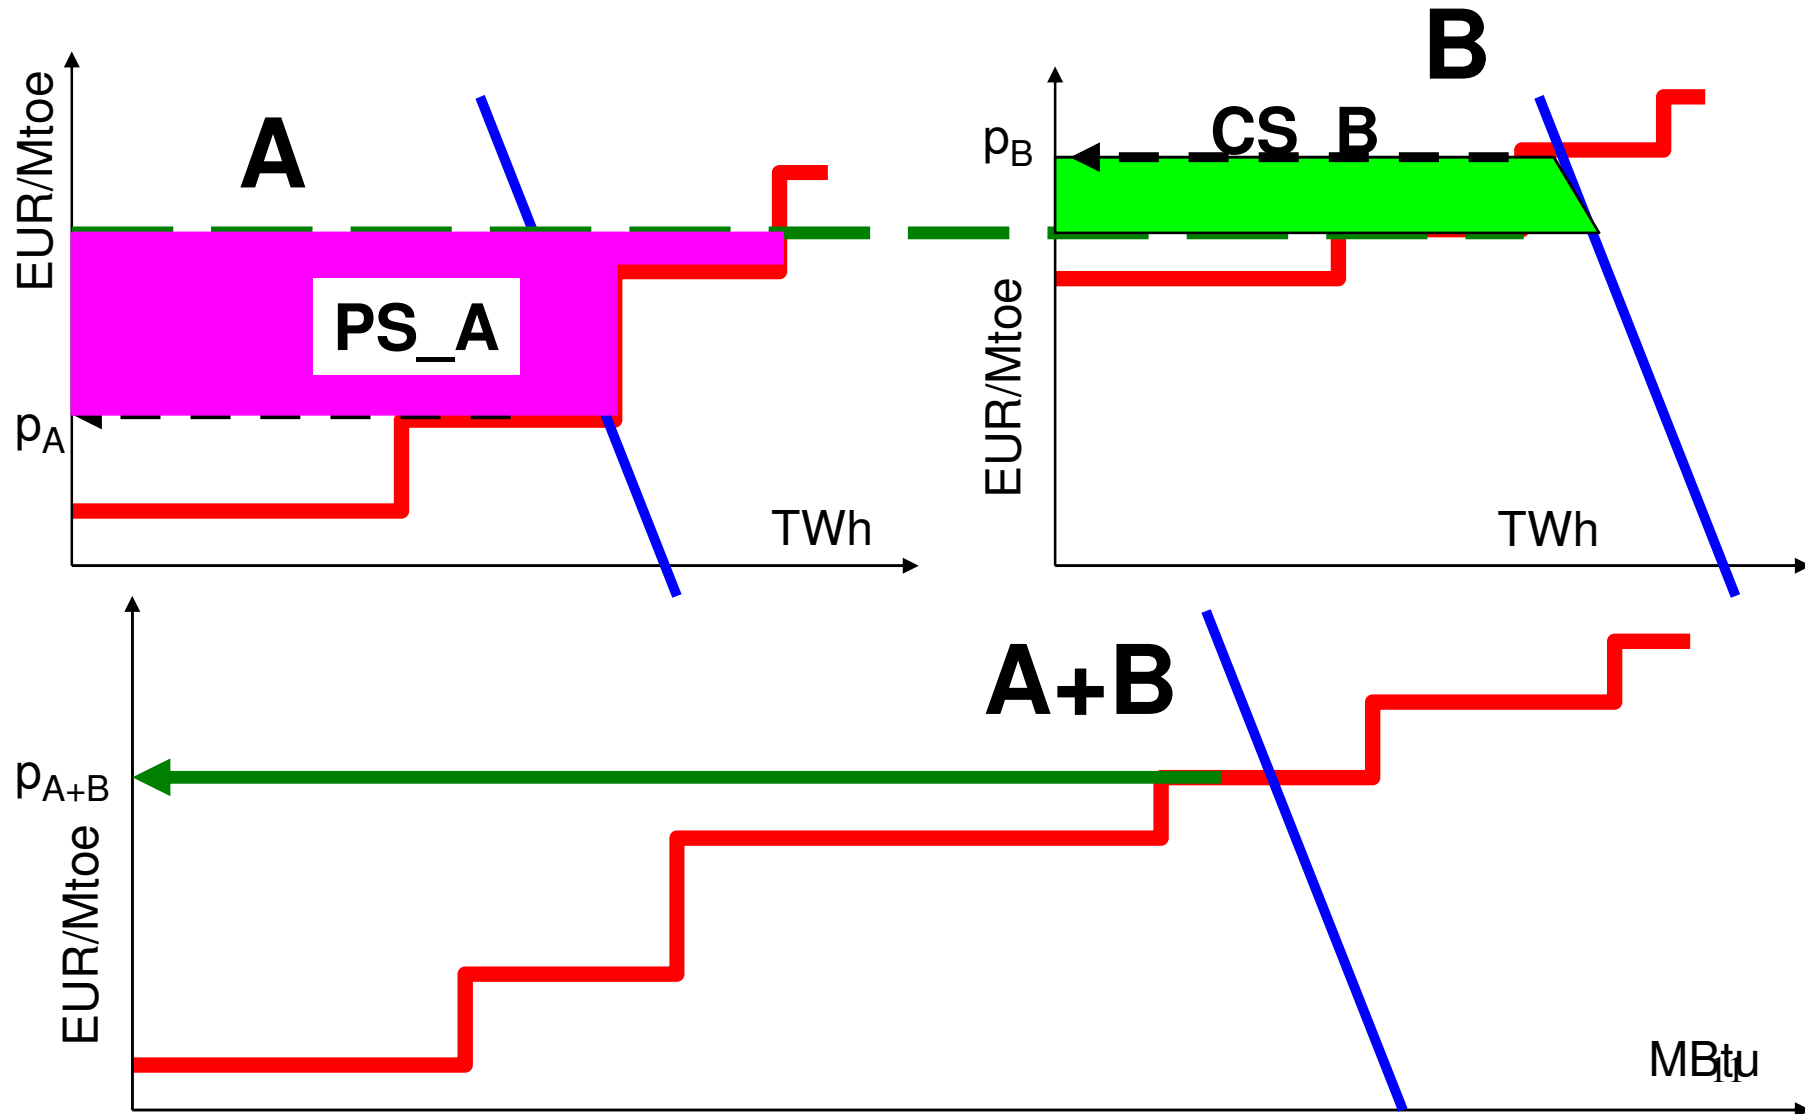

- Trends in generation capacities and load:**

Source: UCTE, Platts, national statistics

- Variations and uncertainties in available capacities play a**

3. MARKET INTEGRATION

3. MARKET INTEGRATION

- **Comparison of price effects:**

- **Are "new" countries really long?**

FRANCE, GERMANY, AUSTRIA – ONE MARKET

FRANCE, GERMANY, AUSTRIA, CZECH REPUBLIC, POLAND – ONE CONVERGING MARKET?

- Hypothetic price effects by integrating

Source: EEX, UCTE, BAFA, TU Vienna

- Price reduction of 4% in the considered period – How

Current household electricity prices (excl. Taxes)

3. PROMOTING RENEWABLES FOR ELECTRICITY AND HEAT

PROMOTING RENEWABLES FOR

ELECTRICITY GENERATION CORE MOTIVATION:

**Policy targets for an
INCREASE of RES-E!**

e.g. 20/20/2020 targets

**RES-E directive: increase share of
RES-E from 12% 1997 to 22% in 2010)**

EU RES targets for 2020: **TU**

Source: Based on European Commission (COM(2008) 19)

REMARK ON RES – DEPLOYMENT IN THE EU-COUNTRIES

- Since about 1997 triggered by EU-directives and EU initiatives
- Yet, specific country success stories very strongly related to national policies design!
- Moreover, current harmonisation efforts not necessarily towards most effective and efficient policies!

Wind in EU-27: Installed capacities per year

ELECTRICITY GENERATION FROM „NEW“ RENEWABLES IN EUROPE

Heat from renewables in EU-27

Main support instruments: Subsidies and income tax incentives for biomass boilers and solar thermal collectors

SURVEY ON STRATEGIES FOR PROMOTING RENEWABLE ENERGY

		REGULATORY	VOLUNTARY
Capacity-driven strategies	Generation-based	GO-Trade	<ul style="list-style-type: none"> National generation targets
	Investment focused	<ul style="list-style-type: none"> Bidding/Tendering 	<ul style="list-style-type: none"> National installation or capacity targets
Price-driven strategies	Generation-based	<ul style="list-style-type: none"> feed-in tariffs, rate based incentives Net metering 	<ul style="list-style-type: none"> Green Power Marketing <ul style="list-style-type: none"> Green tariffs Solar stock exchange
	Investment focused	<ul style="list-style-type: none"> Rebates Soft loans Tax incentives 	<ul style="list-style-type: none"> Contracting Shareholder progr. Contribution Bidding
Other		–	<ul style="list-style-type: none"> NGO-marketing Selling green buildings <ul style="list-style-type: none"> Retailer progr. Financing Public building progr.

MAJOR PROBLEM:

**Correct design of
policy**

- with respect to:
 - which targets to be reached when?
 - Financial incentives
 - Credibility for investors
 - costs for customers

THE ISSUE OF TRANSFER COSTS

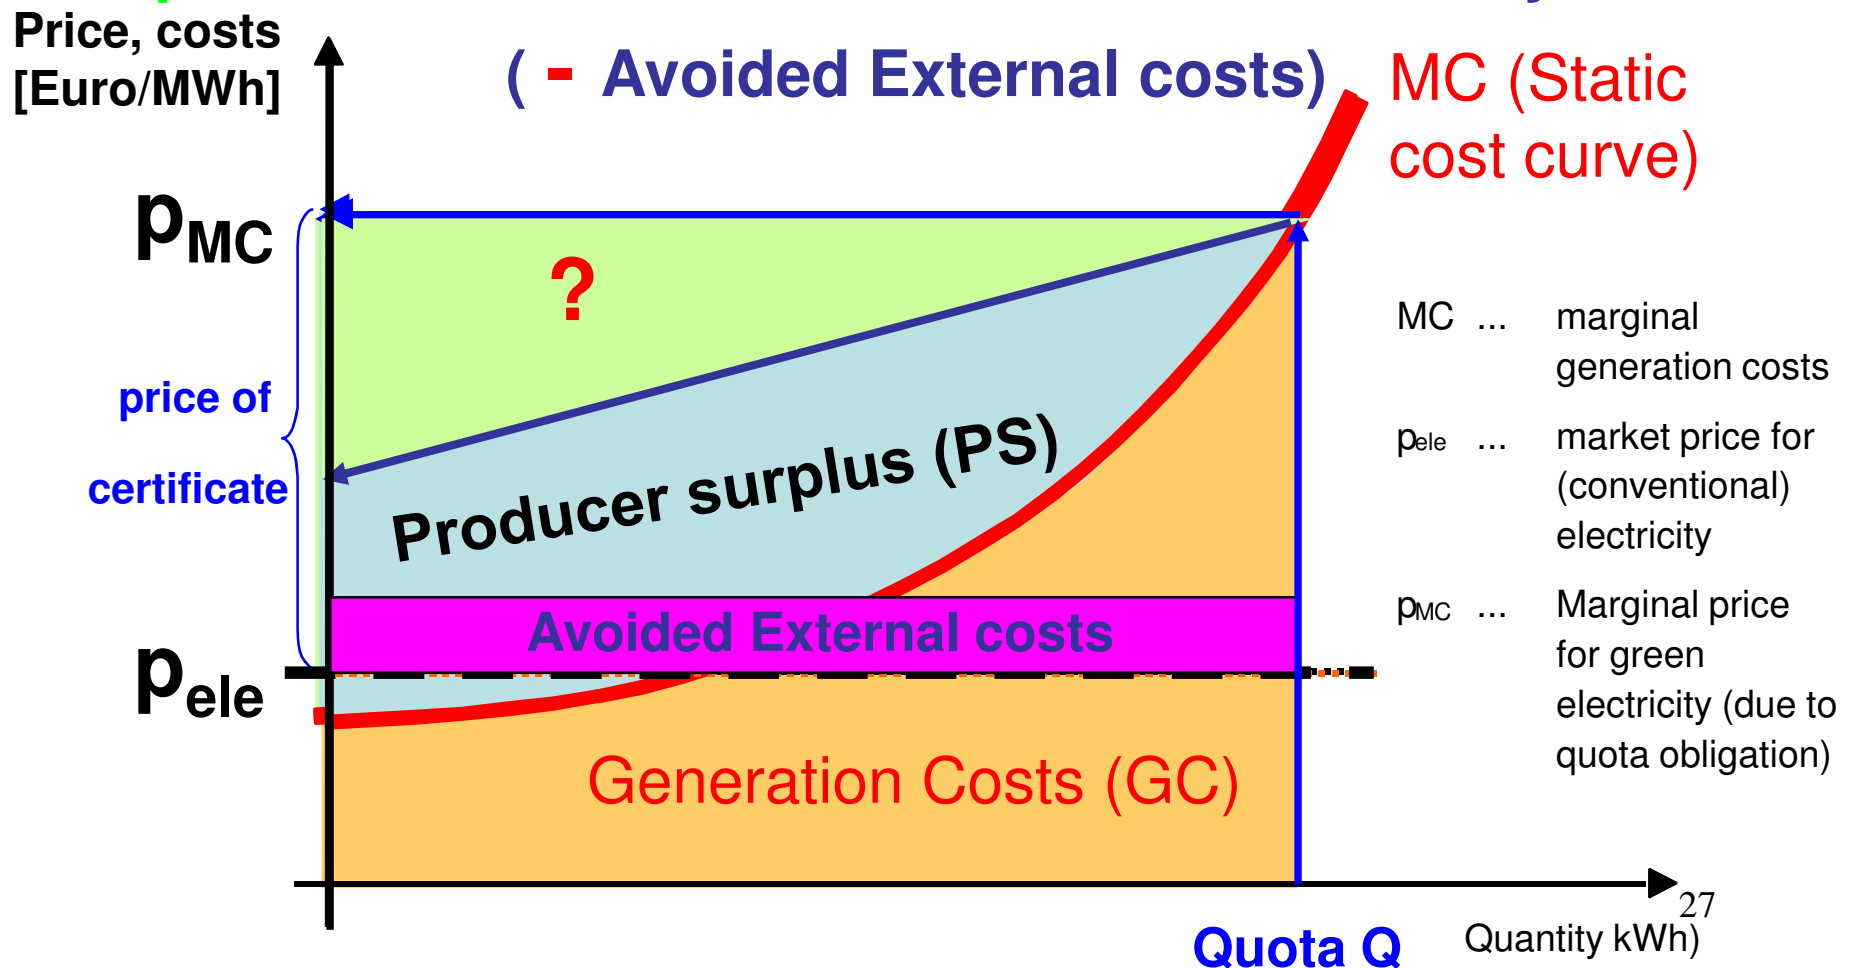

*All regulatory promotion schemes
(Quota-based TGC systems, tendering
systems, Feed-in tariffs) create an
artificial market*

and cause

transfer costs (additional costs)

How to minimise transfer costs

Minimise additional costs for consumers = Producer Surplus + Generation costs - Revenues electricity market

Transfer costs vs avoided costs

Example: Promotion of wind in Germany 2005

***The lower the additional costs
(=transfer costs) are which have
finally to be paid by electricity
customers***

the higher will be public acceptance

***the larger will be the amount of
additional electricity generated from
RES.***

SUCCESS OF STRATEGIES

Major objectives:

- increase the amount of electricity from *renewables* and
- reduce costs!

EFFECTIVENESS VS COSTS

PRICES OF CERTIFICATES

IMPACT OF THE SHAPE OF THE COST CURVE

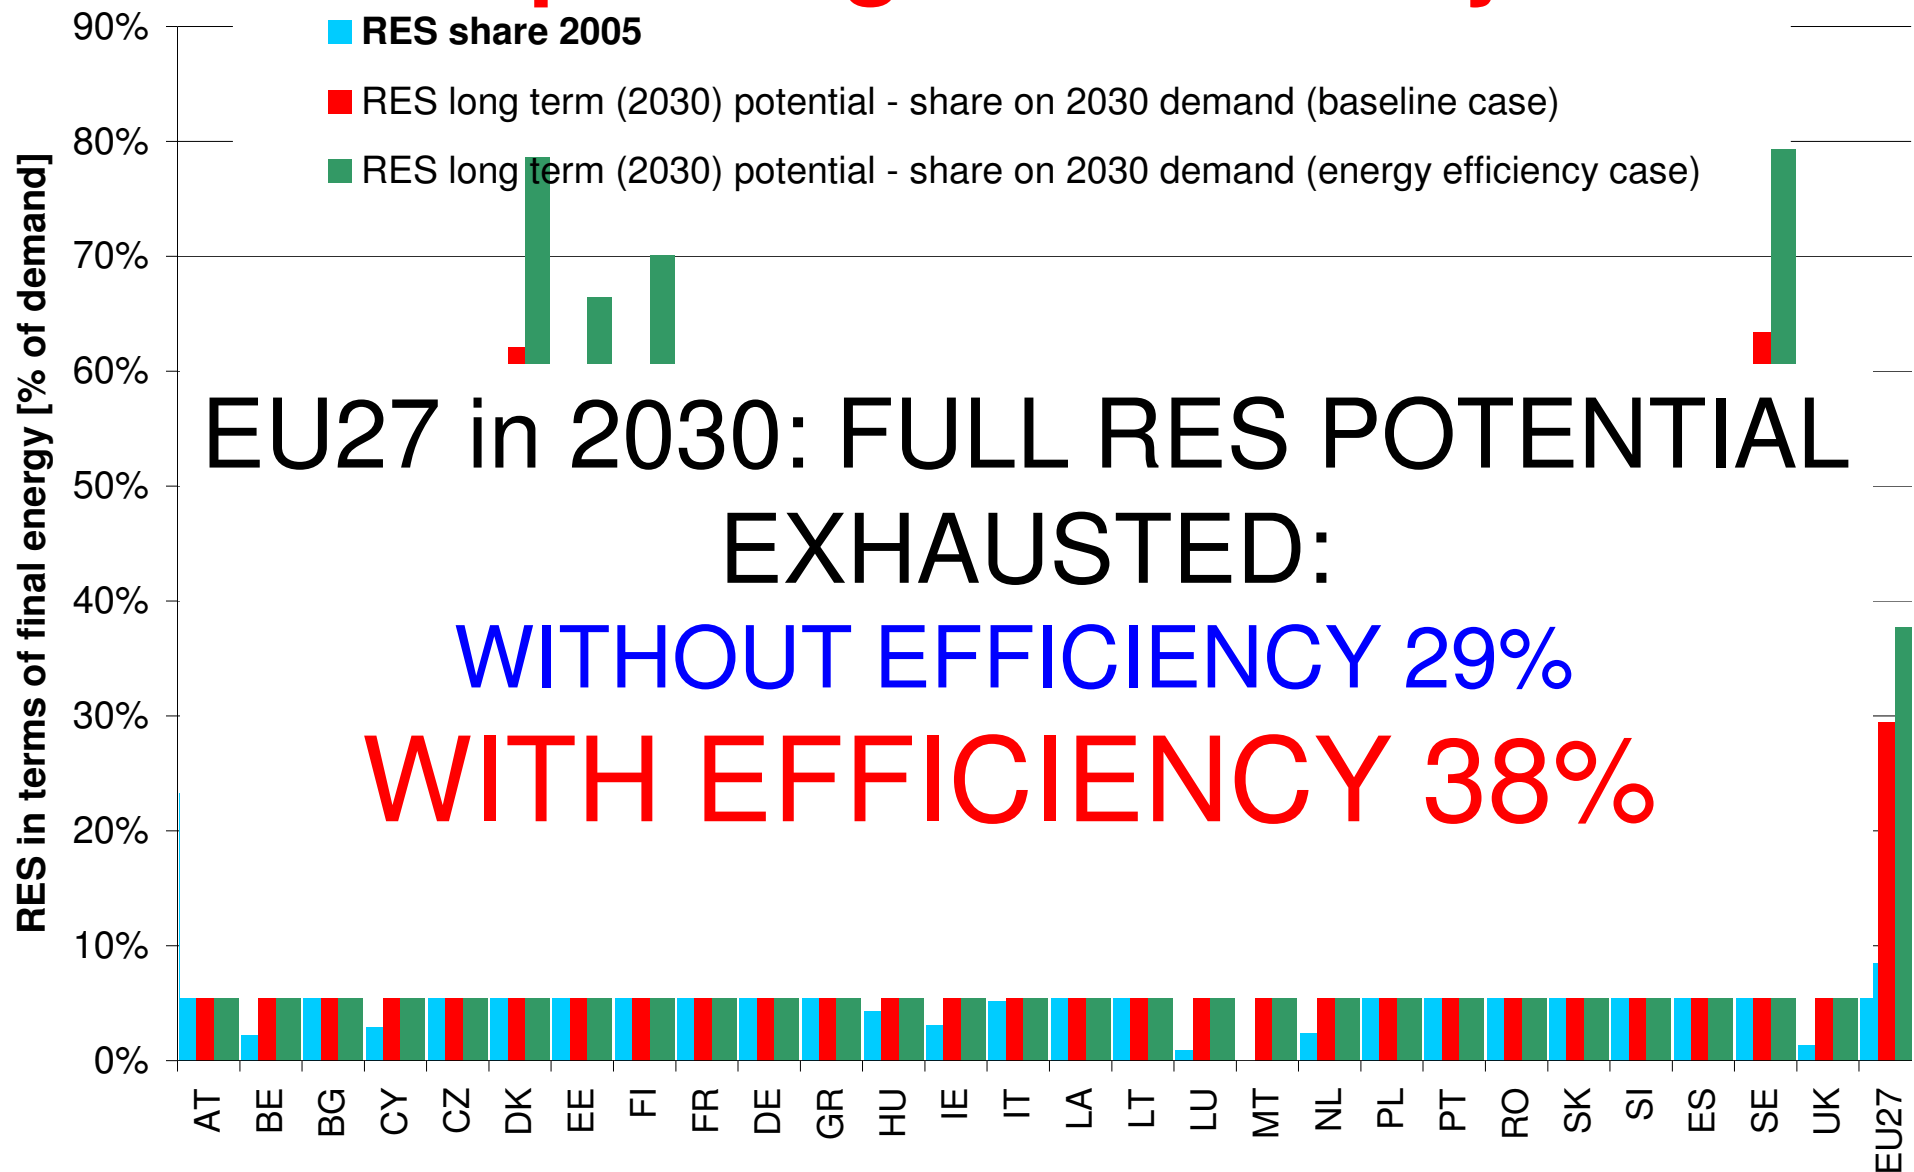

IMPACT OF THE SHAPE OF THE COST CURVE

THE SHAPE OF THE COST CURVE EU - 27

EU27: Potential share of RES depending on efficiency

**IMPROVE/OPTIMIZE THE
CURRENT SYSTEMS
BEFORE HARMONISING
OR IMPLEMENTING
MAJOR CHANGES!**

deployment fastest and at lowest costs for society. We expect GO Trade to be a very expensive way to promotes RES

CONCLUSIONS (2)

- **Instead of harmonisation: Stimulate/Foster competition between promotion schemes/between countries: Which system/where provides new RES-E capacities at lowest costs for society?**
- **Exchange of lessons learned: Improvement of strategy design must build on lessons learned**
- **Promoting RES in EU successful? Yes, but increase in energy consumption outweighed ...**
- **For sustainable policy -> parallel focus on demand-side conservation of high priority!**
- **Supporting RES? Yes, but ... externality-based taxation of all energy carriers preferable!**

Deriving effective least-cost policy strategies for alternative automotive concepts and alternative fuels

(ALTER-MOTIVE)

www.alter-motive.org

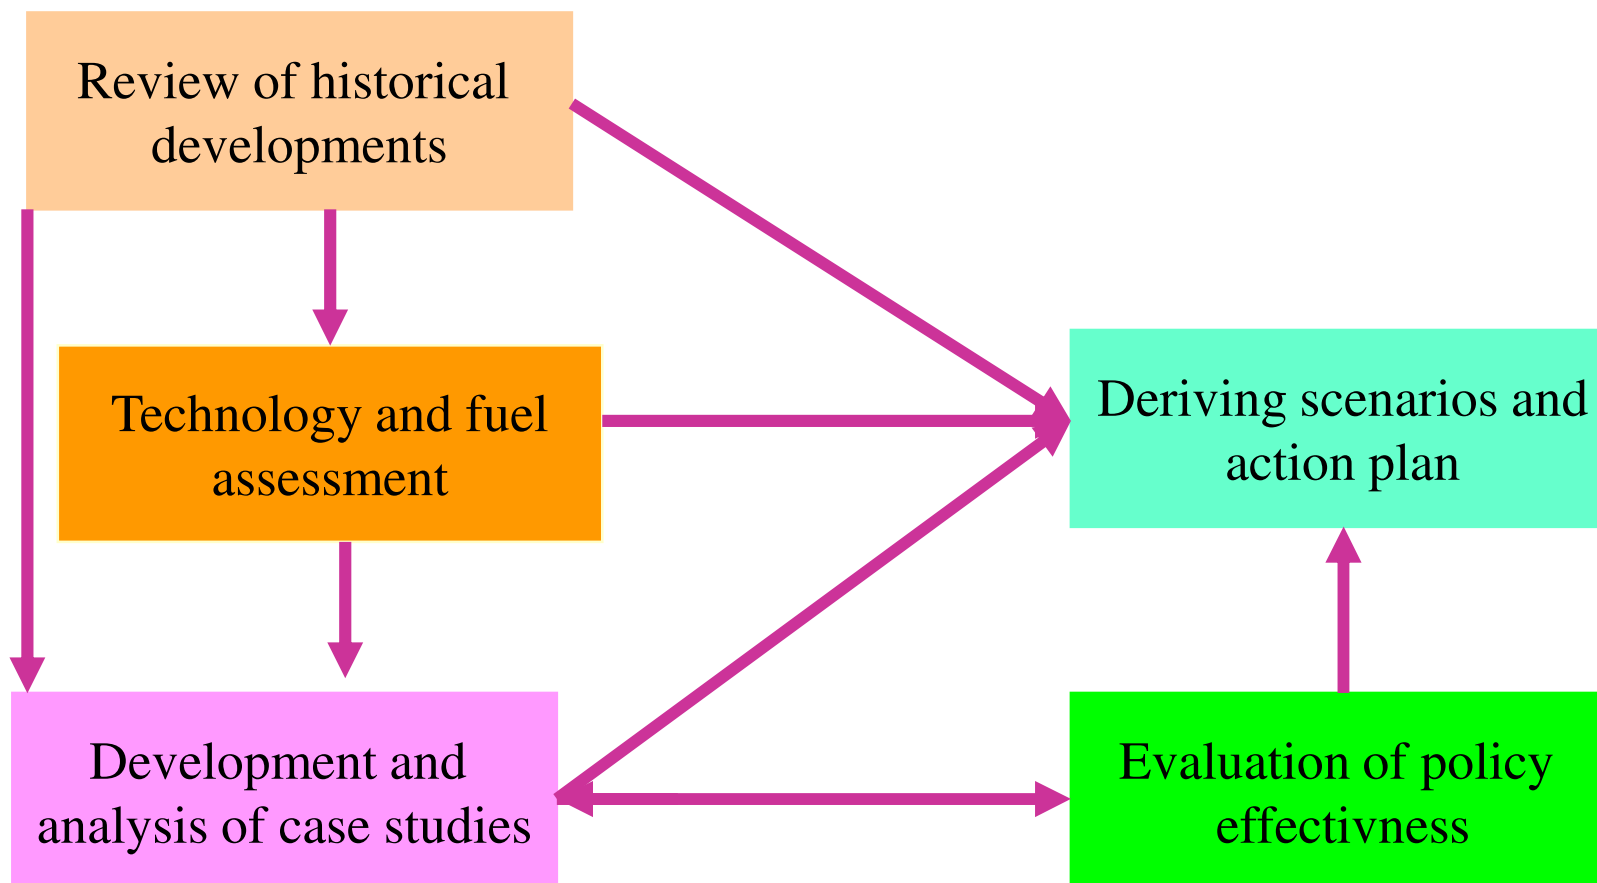

Amela Ajanovic, Reinhard Haas

- **Coordinator:**
- EEG, Vienna university of Technology

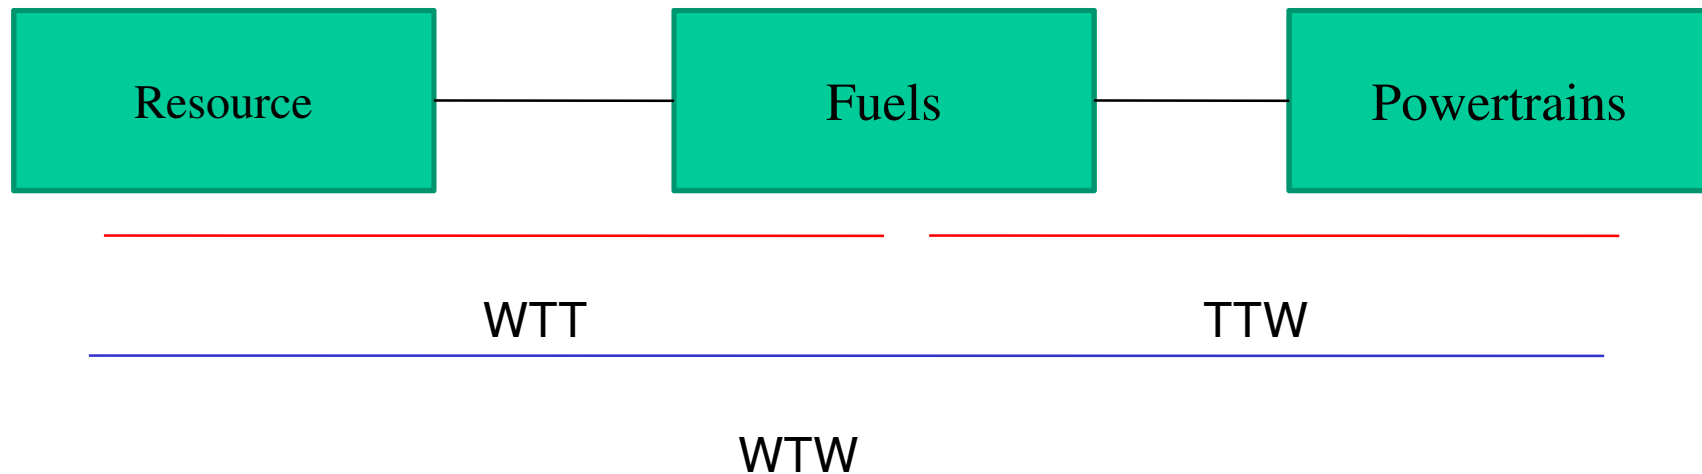

- **Partners:**
 - Stichting Energieonderzoek Centrum Nederland, The Netherlands
 - Eni Corporate University S.P.A., Italy
 - BSR Sustainability GmbH, Germany
 - Wuppertal Institut für Klima, Umwelt, Energie GmbH, Germany
 - AEOLIKI Ltd, Cyprus
 - Black Sea Energy Center, Bulgaria
 - Association Rhônealpiénergie-Environnement, France
 - Centre for Renewable Energy Sources, Greece
 - Stowarzyszenie The Kraków Institute for Sustainable Energy, Poland
 - Chalmers Tekniska Högskola Aktiebolag, Sweden
 - Forschungsgesellschaft Mobilität-Austrian Mobility Research, Austria
 - Sociedade Por Quotas CEEETA-ECO, Portugal
 - Det Økologisk Råd (EcoCouncil), Denmark

- **Duration:**
1 October 2008 - 30 April 2011

- The **core objective** is to derive effective least-cost policy strategies to achieve a significant increase in innovative alternative fuels (AF) and corresponding alternative more efficient automotive technologies (AAMT) to head towards a sustainable individual & public transport system.
- The **heart of this project** is an investigation of about 80 recently implemented successful case studies of pilot projects for marketing AF & AAMT from all over Europe and beyond.
- Furthermore, prospective **scenarios** on the future deployment of AF & AAMT will be developed, showing how to meet EU targets with least-cost for EU citizens based on efficient & effective policy mixes.

Economic analysis

- ✓ Fuel costs (€/l)
- ✓ Investments costs (€/vehicle)
- ✓ Mobility costs (€/km)

$$C(x) = a \cdot x^{-b}$$

C(x): Specific cost
x: Cumulative capacity
b: Learning index
a: Specific cost of the first unit

$$p = 2^{-b}$$

P: progress ratio

Biofuels costs (BFC) :

$$BFC = FC + ACC - Sub$$

Net feedstock costs :

$$FC = FP - ASub - C_{by-product}$$

Average gross conversion costs:

$$ACC = CC + O \& M$$

$$CC = SC * CRF$$

Cost structure of bioethanol

Economic analysis

Total vehicle costs:

$$IC = IC^{CON} + IC^{INNOV}$$

The total transport costs:

$$TC = FC + IC_{sp}$$

$$IC_{sp} = (\alpha \cdot (IC + NOVA) \cdot (1 + VAT)) / D_{km}$$

The fuel cost per kilometre:

$$FC = EC \cdot FP$$
